

# Quotes Recommendation Chatbot using NLP

## Story 2: Creating Bot Responses (domain.yml)

---

### 1. Introduction

Once user intents are defined, the next step is to specify how the chatbot should respond to each intent. This is achieved using the domain.yml file, which acts as the central configuration file for the chatbot.

### 2. Role of domain.yml File

- The list of supported intents
- Predefined chatbot responses
- Actions and session configuration

### 3. Implementation in Quotes Recommendation Chatbot

For the Quotes Recommendation Chatbot, predefined responses such as utter\_motivation, utter\_inspiration, utter\_funny, utter\_love, and utter\_success are created. Each response contains carefully selected quotes that match the corresponding intent category.

### 4. Key Features of Response Design

- Multiple variations of responses are included to avoid repetition.
- Randomized responses maintain user engagement.
- Clear mapping between intents and responses ensures accuracy.
- Consistent structure improves chatbot reliability.
- Session configuration maintains conversation continuity.

### 5. Technical Working

When a user enters a message, the NLP model classifies the intent. Once the intent is identified, the chatbot refers to the domain.yml file to retrieve the corresponding response. The system then selects one response variation and displays it to the user. By clearly mapping intents to responses, the domain file ensures consistency, accuracy, and relevance in chatbot replies, even during repeated interactions.

## **6. Conclusion**

The domain.yml file plays a crucial role in defining how the chatbot behaves and responds. In this project, it ensures structured response management, dynamic quote recommendations, and a smooth conversational experience for users. Proper configuration of this file directly contributes to the effectiveness and intelligence of the chatbot system.
