

Story 3: Deployment Using Web Interface

Quotes Recommendation Chatbot Using NLP

Description

After successful testing and validation, the chatbot is deployed for real-time interaction through a web-based interface. Deployment ensures that users can access the system directly from a browser, eliminating the need for command-line interaction. This step significantly improves accessibility, usability, and overall user experience, making the chatbot ready for practical, real-world applications.

Enabling REST API Communication

To enable communication between the web interface and the Rasa backend, the REST channel is configured in the `credentials.yml` file. This configuration allows external applications to securely send user messages to the chatbot and receive responses efficiently. By activating the REST API, seamless interaction between frontend and backend components is established.

Running the Rasa Server

The Rasa server is initiated with API and CORS support using the following command: `rasa run --enable-api --cors "*" This command enables REST API access and allows cross-origin requests from the web interface, ensuring smooth and uninterrupted communication between client and server.`

Web Interface Execution

- A Flask-based web application is implemented to host the chatbot interface.
- The web page provides a clean and user-friendly chat window for interaction.
- User inputs are captured and transmitted to the Rasa REST API.
- Chatbot responses are received from the backend and displayed dynamically.
- The system ensures a smooth, responsive, and interactive user experience.

Conclusion

Deploying the chatbot through a web interface transforms it from a development-stage system into a fully accessible, interactive, and production-ready application. With complete end-to-end communication between the frontend and backend, the Quotes Recommendation Chatbot is prepared for real-world usage, delivering personalized and meaningful responses efficiently.
