

QUOTES RECOMMENDATION CHATBOT USING NLP

EPIC 1: DEFINE PROBLEM / PROBLEM UNDERSTANDING

Story 1: Specify the Business Problem

In today's fast-paced digital environment, individuals often experience stress, demotivation, emotional imbalance, or a lack of inspiration due to academic pressure, professional challenges, or personal issues. Motivational quotes, inspirational messages, humorous content, and emotional reassurance play a significant role in improving mental well-being and uplifting mood. However, users typically rely on manual methods such as searching the internet, browsing social media platforms, or reading static quote collections to find such content.

This manual search process is time-consuming, inefficient, and lacks personalization. Users are required to filter through large volumes of irrelevant content before finding a quote that truly matches their emotional state or requirement. Additionally, traditional quote websites or applications do not offer interactive engagement, making the experience passive rather than conversational.

The core business problem addressed by this project is the absence of a fast, intelligent, and personalized platform that can instantly understand user emotions or intentions and deliver relevant quotes through natural conversation. Without such a system, user engagement decreases, emotional support becomes less effective, and the overall user experience remains limited.

The Quotes Recommendation Chatbot using Rasa NLU aims to solve this problem by providing an interactive, AI-powered solution that understands user input, identifies their intent, and delivers suitable quotes in real time. By replacing manual searching with an automated conversational approach, the chatbot significantly improves accessibility, relevance, and user satisfaction.

The **Quotes Recommendation Chatbot using Rasa NLU** aims to solve this problem by providing an interactive, AI-powered solution that understands user input, identifies their intent, and delivers suitable quotes in real time. By replacing manual searching with an automated conversational approach, the chatbot significantly improves accessibility, relevance, and user satisfaction.
